

PRO CAT

Remote Location Microphone Interface

Using the same low noise amplification technology as our CAT-5 Driver Series (see pages R27 and R28), the Pro Cat allows you to have remote microphone locations that tie into the main building audio system. Consisting of two stainless steel wall plates that are connected with inexpensive CAT-5 wire, the Pro Cat microphone interface is perfect for banquet halls, auditoriums and other commercial applications where a remote microphone would be useful. Power is supplied at the receiver plate while the transmitter plate maintains a clean look with just the XLR microphone jack. Adjustment of the microphone signal level can be adjusted via a trim pot located on the transmit plate circuitry.

- Stainless Steel Plate
- Easy Installation
- No Signal Loss
- Power Supply Included

PRO CAT AV

Remote Location Microphone and A/V Interface

The Pro Cat AV has all the features of the Pro Cat and adds the ability to connect an audio/video source as well. Consisting of two stainless steel wall plates that are connected with inexpensive CAT-5 wire, the Pro Cat AV microphone/AV interface is perfect for banquet halls, auditoriums and other commercial applications where presentations are given away from the main system. Mount the transmit plate to a podium and allow guest speakers to plug their laptop in without the usual hassle of connecting to the main system. Power is supplied at the receiver plate while the transmitter plate maintains a clean look with just the XLR microphone jack, S-video and RCA audio inputs. The microphone signal level is adjustable via a trim pot on the transmit plate circuitry.

Signals stay crystal clear at distances of 500 feet and up making the Pro Cat AV the perfect choice for even the largest commercial applications.
